.. **how minds work - introduction**

Worst episode ever

What makes it a delusion?

Spotting delusions

Hallucinations

Confused thinking

Changed feelings

Why me? The causes of psychosis

Moving on, moving up

How minds work — the wrap-up

## How minds work

(Also: what happens when they don't, and how they definitely can get better)

“ I gradually thought, this can be beaten. Not beaten, but controlled, lived with. I wasn't ashamed then to admit it to myself and I told others because, with improvement and control ... I saw it wasn't the end of the world

Lee, who has schizophrenia, on moving on.

First things first: just like every other human being who ever lived, you've got a mind. It seems like an obvious thing to say, but it's the basis for everything you're about to learn. Your mind is what you think with and what you feel with. It makes sense of what your eyes, ears, nose, tongue and fingertips tell it about the world around you. It's the part of you that imagines and dreams.

And just like all the other parts of you, your mind can get overworked and overwhelmed. It can be tricked and it can make mistakes. And here's the first important thing for you to know: that's how normal minds work. A healthy, working mind isn't a computer: it's a creative thing that tries out different ways of understanding the world. Most of the time it makes a helpful, reasonable, accurate picture of the world. Sometimes, though, it gets things wrong.

'Psychosis' is a word used to describe one of the ways a mind can go off-track.
